

How do you make more out of the same? if you have a ruby, and you are negotiating with the tribesmen, you want to get more rubies to buy more goods, and more goods to buy. this is called bulk usually, but we are concerned with the ruby for say a watermelon.

You have one ruby, and there is one watermelon. if you were to split the water melon and rubies, you would have a currency and a product line. this means there is the same of the same. we want more from the same!

If you were to bond more to the melon or ruby, you could make more of them. this can be done by rubbing them like an urn. rubbing them certain ways will make them rub off or out, but rubbing them the right way will make them heat up and grow.

But that is cheating! we want to make more out of the same! if we were to split them a certain way, could we split them to be bigger? physicists split atoms to give off more energy than they do by turning them into stars. this means that negative energy is released or drawn upon. basically, we should be able to do the same with the melon or the ruby!

If we were to split the melon correctly, we could split it so it grows until it is too small to split. even though this is 'second place,' i will go for it!

Okay, so, you need to split the melon so as to excite the bonds it has. this can be done by splitting the seeds inside it. this will make the watermelon grow out immediately, as, heat ages things, and in aging things they will grow to their full maturity. so, done correctly, we could grow melons out of seeds in a few minutes, and grow babies to full maturity in a few months, yes?

So, we need to find the correct way to split the 'seeds.' but, what about the rubies? there must be a way to split them too? i suppose if we split it at a right angle or half triangle, we could

make them grow out from that, as, they are 'life' too, as they are reactive, yes? if we were to 'cut' or emit a beam of laser light onto a angle or point of the ruby - the more acute the better - then we could 'pull it out.' if we were to put our fingers onto the angle or point, and, using some magical prowess, drag it out, we would deplete our sugar supply, but we would have more rubies, more melons for sugar, more rubies, and so forth. to 'drag it out' we need to place our fingers on it very gently and then use our minds to do it.

Now, understanding how it works will help our minds do it! if we were to observe that we want to bond more atoms to the ruby, then we will be diluting it, but, not if we have all the gens family with us in the air. out of the air came the earth, so it is possible to make this work! all we need to do is study how air became solids, and then fine tune it so that the solids are actually rubies or something. i suppose this could be done by with the 'oxides' as they will be solid nearly already. this means we must hold our finger on the point of the ruby and blow onto it, focusing our energies into the rubies bonds and creating new ones. if we have chalk or something, we could rub it onto the ruby, then rub it off the ruby to make it grow slowly. this will leave the impression that it is bigger, but is basically cheating. i think we need to know more about how rubies grow out of oxides. then, understand it, and do it with the power of our minds. the seeds are easy to grow with heat radiation.

I was watching a movie, and my mind started bending. it was lara croft tomb raider, and, Prometheus actually. this was quite recent. it seems, through some deluded fantasy, some people think they can cross over into other worlds or something - leading me to the movie i want to discuss - Flatliners.

In flat liners, people stop their hearts long enough, for, the way i see it, their energies to manifest with the planetary energies around them, or, all other energies. it is like waking up, you could say. everyone wants to see the afterlife, so, this thread is about

seeing said afterlife.

If you were to look around you, there are said energies on display all the time. the thing is, they deal with matter, or liquid, and it is hard to see air. now, the air, well, it is all over space! there is a lot of it. the way i see it, the most common elements are, first, air, then fire, then earth, then oceans. this is because the air is obvious, the suns are big and the center of the planets are usually hot - melting the earth together, then there is land like the planet's crust, then there is water on the outside of the planet.

So, if we need to become air elements instead of water, earth and fire - as we are heated - then there needs to be some translation into air elements - when we go to heaven or whatever. we use the air, then we become air. everything starts off as air, so, maybe we could believe in reincarnation, or, to some extent, a cycle?

Now, if we want to see the afterlife, we need to use lasers or things to excite the air. this is like a mystic looking into a fire and saying what will happen tomorrow or something. we need to take it in with our nerves to register it, so, it needs to have photons, so, looking into the sun would be a good idea, yes? but, looking into carbon monoxide would be a bad idea as it is still settling down.

If we were to want to see heaven, we would need to go through a prism, as, that will refract - yes a big word! - light. we could use said prism to make it so we can make out light. think of shining a light into a prism and getting a color spray? if you were to watch the color spray, or, get the colors back into one 'beam,' it might illuminate or show us how to see into heaven, yes?

So, if you did get a prism, and shine it into another prism, the gamma rays would dilute, get less excited, and eventually show you something.

Of course, communicating with the things we see could be hard, as they may be faeries. luckily, sound waves affect everything with mass, and, even air has mass. this means, of course, that while they might not have vocal chords, we can still affect them by waving at them or through them, or, more logically, around them. we could shae them, maybe?

If we were to speak 'at' them, we could make a reaction, as, there is a one world conscious, and, faeries are very sensitive. maybe six prisms will magnify it six hundred times i hear, not sure. we need to look and listen. maybe we will just see things, maybe we will see the deceased, maybe we will see mirages, maybe we will see our imaginations manifest - hey this could be cool for trials, yes? - or maybe we will see something that is aware of us?

I was looking for a movie called the sphere, and stumbled upon this thing called the ten spheres of life. basically, it makes things like legal things a sphere of life.

<http://www.oocities.org/gulcm/10spheres.html>

So, if you want to find spheres of life, you need to understand we all all organisms. life, as referred to by the many, is where something seems to have a will of it's own, or to resist the natural call of life a little bit, or a lot. also, living things will effect other things more than non living things, so a rock that holds a door open will not affect things as much as a human being spewing CO2 into the air, yes?

Now, if life is defined by how things are affected by it, then our lives are defined by things that affect every one of us.

If the spheres of life were to be observed, there is self and resources. we need resources to live, and we have self to care for. then there are things like community, where we find solace in

the comfort of others, or, just to be around other life, and then we find also that there is maths or language.

What i am saying is that there is things, self, community and language to be observed as the spheres of life on earth.

But, what about the after life? there must be things there that will affect us? the way i see it, we are made out of energy - our souls - and this energy does not get destroyed when we die, as energy is never destroyed, it just changes forms. so, we float about interacting with other energies and then we just keep doing it, so, maybe there are five spheres of life, being energy, mass, community, self and language.
